## NATURE

*"The area catches my eye and something within me stirs, that something which excites me to make images, that place within where I allow my senses to flow easily into the glorious soup of self-expression. Once the lure is experienced, I'm addicted."*

By Chris Pinchbeck

I've passed this location hundreds of times before with a watchful eye, always telling myself I'll get back to it. This evening is different. The area catches my eye and something within me stirs, that something which excites me to make images, that place within where I

allow my senses to flow easily into the glorious soup of self-expression. Once the lure is experienced, I'm addicted.

Tonight is one of those nights; all the ingredients have come together. The light couldn't be more perfect, the subject matter, a waterfall on a small stream in my hometown, is one I love. I have my camera, film,

Megunticook Stream, Camden, Maine.

Fujichrome 100D, 4 seconds at f/11 with a Canon A2E, Canon 100-300mm lens. While feathering the moving waterfall, anything else moving during the exposure will also blur. I waited patiently for the wind to subside for the leaves to render sharp. A sturdy tripod is a must. Take advantage of mirror-lock-up features on cameras to reduce shake during long exposures. Photo © 1999, Chris Pinchbeck, All Rights Reserved.

and tripod. I must stop and make images.

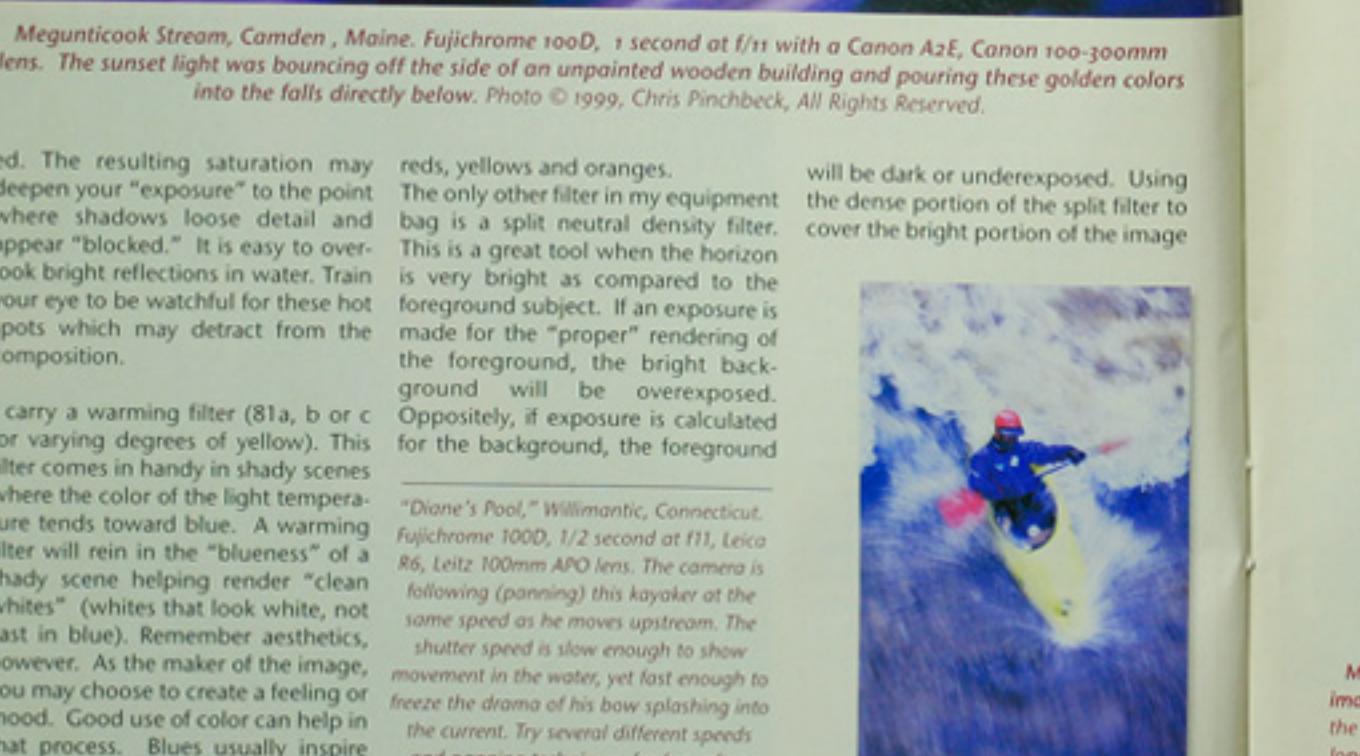

In a short time, the light has played off the waterfall, providing a potpourri of image opportunities. On the drive home, I reflect how diverse water can be in front of our camera and how our craft allows us to capture it effectively in so many different ways.

A walk up a local stream side or shoreline helps me practice the art of seeing. I find it important to hone my eye with a camera as well as without one on hand. Without a camera, I'm able to see the whole story, how it all comes together, uncensored. Our viewfinder censors. It is important for us to be comfortable and knowledgeable about the subjects we chose to create stories about through our imagery.

Technically and artistically speaking, water as a subject provides many exciting photographic possibilities. Consider its ability to move, its reflective qualities, unequaled translucency, and the variety of sources and forms it can be found in.

Making images near water does not require much in the way of specialty photo equipment. However, proper planning and consideration of water's hazards are important for ultimate safety and enjoyment. Above all else, water creates terrain with which we're not usually accustomed to moving about. Rocks can be slippery, waves and rapids can be deceptively powerful, and the list goes on. Wearing a life vest when close to water with slippery or difficult footing is wise. Use sound judgment. If alone, make sure friends or family know where and when you will be making images.

Gradually transitioning into the foreground simply facilitates the reduction of the contrast range between the two elements of your composition. The film thereby renders detail throughout the image.

The resulting saturation may deepen your "exposure" to the point where shadows lose detail and appear "blocked." It is easy to overlook bright reflections in water. Train your eye to be watchful for these hot spots which may detract from the composition.

Use of shutter speed variations is an exciting aspect of shooting water. A fast shutter speed will freeze the motion of water. Freezing the movement of a powerful wave or rapid can portray a sense of power. A slow shutter speed feathers the movement of water. In rapids or waves, this may produce a pleasing dream-like quality.

Reds, yellows and oranges. The only other filter in my equipment bag is a split neutral density filter. This is a great tool when the horizon is very bright as compared to the foreground subject. If an exposure is made for the "proper" rendering of the foreground, the bright background will be overexposed. Oppositely, if exposure is calculated for the background, the foreground

will be dark or underexposed. Using the dense portion of the split filter to cover the bright portion of the image

Diane's Pool, Willimantic, Connecticut. Fujichrome 100D, 1/2 second at f/11, Leica R6, Leitz 100mm APO lens. The camera is following (panning) this kayaker at the same speed as he moves upstream. The shutter speed is slow enough to show movement in the water, yet fast enough to freeze the drama of his bow splashing into the current. Proper placement over the bright background mountains allowed the scene to fall into the film's contrast range. The film was able to record detail in all areas without either blocking up the shadows or blowing out the highlights. Photo © 1999, Chris Pinchbeck, All Rights Reserved.

Chris Pinchbeck uses an assortment of camera bodies for his nature photography. For 35mm equipment, he uses both Canon A2 and Leica R6 bodies. He uses his Canon for faster action images with Canon fixed focal length and zoom lenses; 24mm, 28mm, 105mm and 100-300mm. He sometimes supplements natural lighting with a Canon 430 EZ flash. For his Leica bodies, he carries strictly fixed Leitz lenses; 24mm, 50mm, 100 macro, 250mm and macro bellows. His large format equipment includes a Linhof Master Technika field 4x5, 75mm Rodenstock, 90mm Nikon SW, 120mm Schneider and 240mm Schneider lenses with 6x9cm and 6x12cm roll film backs. He uses a Gitzo Studex tripod with an Arca Swiss Monoball. His filters include split neutral density, slight warming (B+W KR3), and a polarizing filter.

Chris Pinchbeck is a commercial nature photographer living in Rockport, Maine. His work is published internationally and he teaches at The Maine Photographic Workshops. He is represented by Image Quest stock agency in St. Louis, Missouri. Chris' work may be viewed on his web site at [www.pinchbeckphoto.com](http://www.pinchbeckphoto.com) or at [www.iqstock.com](http://www.iqstock.com).
